

# ELECON ELIGN MULTI CROWNED GEAR COUPLING

**ELECON** 

*Always a step ahead in technology*

## GEAR COUPLING

Ever Since its inception in 1951 Elecon's endeavour is to consultantly update the products and offer superior products to its customers based on the latest technology available. Such a long experience in the field of development, design and manufacture of Power Transmission Equipment has led to the development of a new series of **ELIGN Gear couplings**.

The **ELIGN Gear couplings** are manufactured in Elecon's state of the art technology manufacturing plant on precision CNC machines. The new series of Gear couplings has a technology superiority compared with the other gear coupling available in the market. The usage of high quality material and workmanship is built-in-feature of **ELIGN Gear couplings**.

### WHY GEAR COUPLING ?

A Gear Coupling is used to join two rotating shafts for efficient transmission of mechanical power. Although the shafts are accurately aligned at the time of installation, it is likely that during the operation the alignment may get disturbed due to setting of foundation, thermal expansion, shaft deflection, wearing out of other parts, improper maintenance and many more reasons. Due to this unavoidable misalignment occurring during the operation a gear coupling provides a better solution to compensate or minimise the effect of misalignment.

The gear Couplings are therefore ideally suited for wide range of application in the entire field of drive technology.

### MISALIGNMENT

The main function of any Gear coupling is not only to connect two rotating shafts but also to accommodate mis-alignments of the connecting shafts **ELIGN Gear coupling** accommodates the following three types of misalignment.

#### A. Radial

When axes of connected shafts are parallel but not in the same straight line

#### B Angular

When axes of connected shafts intersect at centre point of coupling but not in the same straight line.

#### C Combined radial and angular.

When the axes of connected shafts do not intersect at point of coupling and are not parallel.

Besides above three types of misalignment, the **ELIGN Gear coupling** also permits axial movement of the shaft..

### CAUTION.

Normally permissible angular mis-alignment of **ELIGN gear coupling** is  $\pm 0.75^\circ$  for each half. However, it does not mean that the misalignment should be permitted to this limit from the initial installation. Since in case of misalignment occurring during operation the Elalign gear coupling takes care of it without undue damage to the connected equipment, however the coupling's life may reduce due to relative motion between hub teeth and housing teeth causing fast wearing out of teeth.

It is therefore extremely important to align the interconnecting shafts precisely during initial installation.

## FEATURES OF ELIGN COUPLINGS

**ELIGN Gear coupling** consists of hubs with multi crowned teeth at Flank, tip and chamfering on teeth.

**Crowned Flanks :** Flanks of the teeth are crowned so that tooth thickness is greatest at that centre of the tooth. This assures larger contact area per tooth for higher torque requirements and puts more teeth in contact for a given angle. Actual tooth loading takes place near the center of the tooth face where tooth thickness is greatest, Crowned flanks also eliminate end-of-tooth loading, provide optimum load distribution, and accommodate all types of misalignment with minimum backlash.

**Crowned Tips :** Tips of teeth are crowned. The crowned tip contacts the root of internal gear teeth in the external sleeve, accurately piloting the sleeve with true concentric ball-and-socket action. This allows minimum diametral sleeve clearance and centers the sleeve physically to assure good dynamic balance characteristics under various loading and misalignment conditions.

**Crowned Chamfers :** Faces of the teeth adjacent to the tips are chamfered to eliminate interference with the sleeve tooth fillets. This allows the true involute flanks of the gear teeth to be in contact with the sleeve teeth and assures freedom to misalign.

The hub teeth are manufactured on CNC machine. The hub is the heart of any gear coupling and a superior design and tooth profile of the hub enables the gear coupling to operate satisfactorily under all operating conditions with increased reliability and long life.

The multi crowned teeth also reduce the alignment adjustment and improve the load carrying capacity of the teeth. the backlash between the teeth is minimal due to multi-crown tooth design. This is where **ELIGN gear coupling** scores over other gear coupling available in the market.

**ELIGN gear coupling** is a simple, compact and light unit for transmitting the same power when compared to the couplings of similar capacity available in the market. It is manufactured out of tested quality forged carbon steel and passes through a number of quality checks.

**ELIGN couplings** are manufactured as per AGMA standard. Each half of the coupling is interchangeable with any of the other half, of same size of Coupling.

**ORDERING INFORMATION**  
**WHEN ORDERING, SPECIFY FOLLOWING INFORMATION**

- 1 Quantity and delivery requirements
- 2 Shaft or bore sizes and keyway dimensions. Give exact dimensions with tolerances.
- 3 **Load** — Horsepower and/or torque at a specific RPM. State normal and maximum conditions.
- 4 **Speed** — minimum, normal and maximum.
- 5 **Application** — type of driver and driven equipment.
- 6 Coupling Series, Type and Size.
- 7 **Space limitations** — envelope dimensions, shaft extensions and shaft spacing.
- 8 Unusual misalignment conditions.
- 9 **Modifications** — tapered bores, special keys, hub cut off, counterbores or others
- 10 Unusual operating conditions ambient temperatures and atmospheres.

**SELECTION**

- 1 **Obtain Shaft Sizes** Compare shaft sizes of driving and driven equipment with listed maximum bores of desired Series or Type coupling to determine "tentative" Coupling size
- 2 **Compute effective kw/rpm or torque to be transmitted** select a service factor from adjacent table Determine

$$\text{kW/RPM (effective)} = \frac{\text{kW TRANSMITTED} \times \text{S.F.}}{\text{RPM}}$$

or determine Torque daNm as

$$\text{Torque (effective) daNm} = \frac{955 \times \text{kW}}{\text{RPM}}$$

Confirm "Tentative" Coupling size or increase to a size which has a kW/RPM torque rating equal to or greater than value computed above.

- 3 **Check Maximum Speed of Application** Refer to maximum speed ratings. These speeds are given only as a guide since the maximum speed depends on the system characteristics.
- 4 **Check Space Limitations** Dimensions of the selected coupling should be compared with space provided in the application to assure proper clearances. Shaft extensions, separation, and clearances to align coupling should be checked.

### ↑ Lifting Hole

The hubs of the couplings from size ED 1600 onwards are supplied with lifting holes to facilitate lifting of coupling.

### ↑ Lubrication

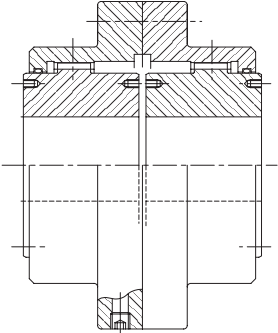

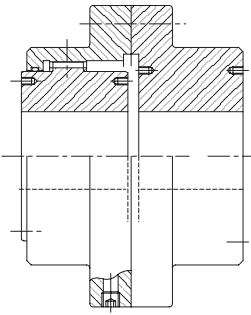

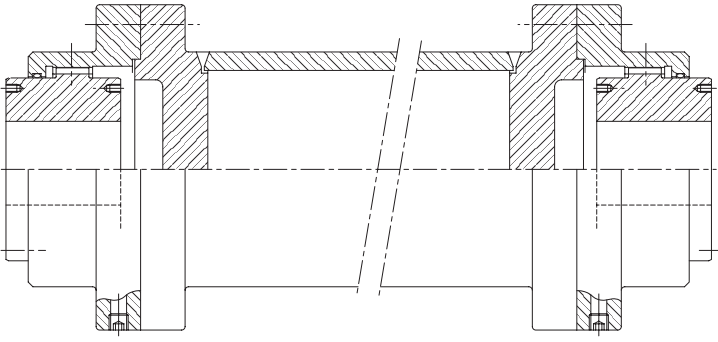

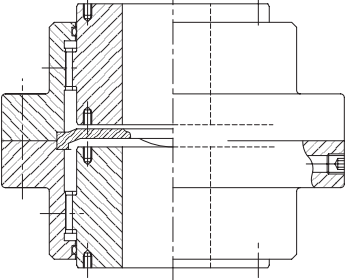

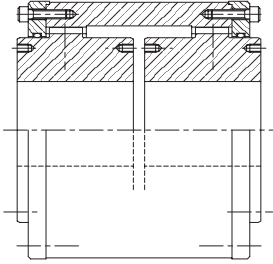

Each coupling half is provided with grease nipple/plug on the housing from where grease can be filled directly. The coupling are supplied with some quality of grease to facilitate assembly. It is recommended to fill the required quality and quantity of grease before putting the coupling in operation.

### ↑ Special Protection

All the components of **ELIGN gear couplings** are applied a special rust preventive oil coating. Besides all the bolts & nuts are zinc plated to give protection towards rust & corrosion.

# TYPES OF ELIGN GEAR COUPLINGS

The following types are available

<p><b>Type ED</b></p>		<p>With Double housing The couplings are available with bore limitations upto 240 mm and torque ratings upto 11500 da Nm</p>
<p><b>Type ER</b></p>		<p>With one end rigid The coupling are available with bore limitations up to 240 mm one side and 280 mm on rigid end and torque ratings upto 11500 da Nm.</p>
<p><b>Type ET</b></p>		<p>With Spacer The couplings are available with bore limitations upto 240 mm and torque ratings upto 11500 da Nm</p>
<p><b>Type EV</b></p>		<p>For vertical application The couplings are available with bore limitations upto 240 mm and torque ratings upto 11500 da Nm</p>
<p><b>Type ES</b></p>		<p>With Single housing The couplings are available with bore limitations from 40 mm to 240 mm and torque ratings from 1600 da Nm to 11500 da Nm</p>

1 SPACE REQUIRED TO CHANGE THE SEAL

2 KEYWAYS ACCORDING TO DIN:6885 PART-1

3 MAXIMUM ANGULAR MISALIGNMENT PER COUPLING HALF  $\pm 0.75^\circ$

4 WEIGHT & MOMENT OF INERTIA WITHOUT INTERMEDIATE HOLLOW SHAFT.

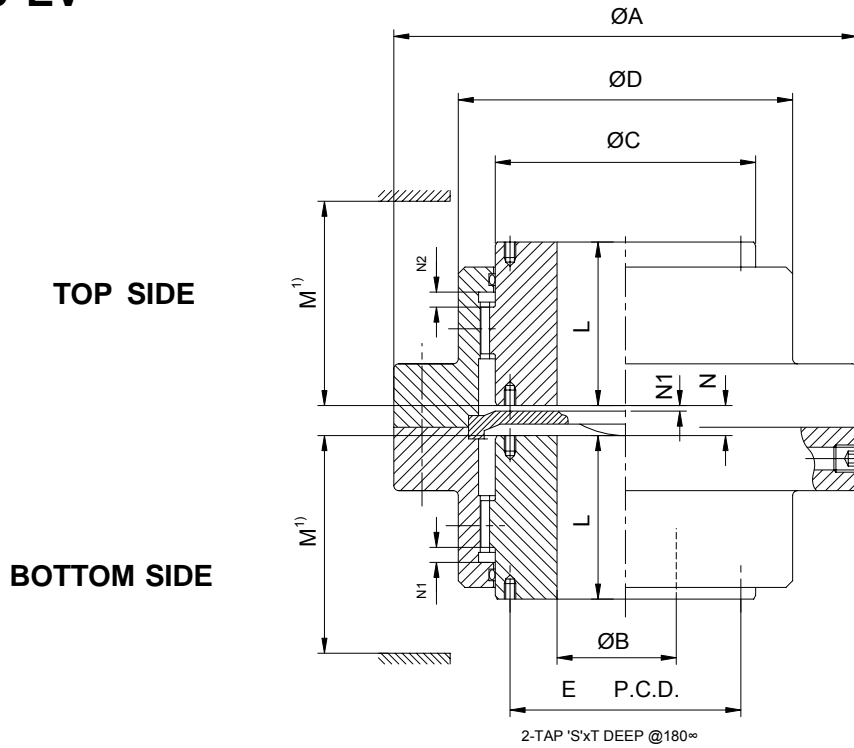

5 CONTINUOUS TORQUE RATING SUBJECT TO ACCURATE ALIGNMENT OF CONNECTING SHAFTS.

6 FOR HIGHER SIZE REQUIREMENT SEND REQUEST.

In accordance with our established policy to constantly improve our products, the specifications contained herein are subject to change without notice
